Contents

Chapter 1. Introduction

1.1. A general motivation for the modelling approach

Chapter 2. Framework

2.1. White noise

The 1-dimensional, d-parameter (smoothed) white noise
The (smoothed) white noise vector

2.2. The Wiener-Itô chaos expansion

Expansion in terms of Hermite polynomials
Chaos expansion in terms of multiple Itô integrals

2.3. Stochastic test functions and stochastic distributions

The Kondratiev spaces $(\mathcal{S})_\rho^{m;N}$

The Hida test function space $(\mathcal{S})$ and the Hida distribution space $(\mathcal{S})^*$
Singular white noise

2.4. The Wick product

Some examples and counterexamples

2.5. Wick multiplication and Itô/Skorohod integration

2.6. The Hermite transform

Definition
Relation to Wick product
The characterization theorem for $(\mathcal{S})_{-1}^N$
Analytic functions and Hermite transforms
Examples: $\exp^\diamond$, $\log^\diamond$, Wick inverse
Positive noise
The positive noise matrix

2.7. The $(\mathcal{S})_{\rho,r}$ spaces and the $\mathcal{S}$-transform

Definition
Relation to the $\mathcal{H}$-transform

2.8. The topology of $(\mathcal{S})_{-1}^N$

Stochastic distribution processes; continuity, differentiation, integration

2.9. The $\mathcal{F}$-transform and the Wick product in $L^1(\mu)$

Functional processes

2.10. The Wick product and translation

2.11. Positivity

Chapter 3. Applications to stochastic ordinary differential equations

3.1. Linear equations

Linear 1-dimensional equations
Some linear multi-dimensional equations

3.2. A model for population growth in a crowded, stochastic environment

3.3. A general existence and uniqueness theorem

The general linear multi-dimensional equation

3.4. The stochastic Volterra equation

3.5. Wick product versus ordinary product

A comparison experiment

3.6. Solution and Wick approximation of quasilinear SDE

Chapter 4. Stochastic partial differential equations

4.1. General remarks

4.2. The stochastic Poisson equation

The functional process approach

4.3. The stochastic transport equation

Pollution in a turbulent medium
The heat equation with a stochastic potential

4.4. The stochastic Schrödinger equation

$L^1(\mu)$-properties of the solution

4.5. The viscous Burgers equation with a stochastic source

4.6. The stochastic pressure equation

The ϕ-smoothed positive noise case
An inductive approximation procedure
The 1-dimensional case
The singular positive noise case

4.7. The heat equation in a stochastic anisotropic medium

4.8. A class of quasilinear parabolic SPDEs

4.9. SPDEs driven by Poissonian noise

Appendixes
Appendix A. The Bochner-Minlos theorem
Appendix B. A brief review of Itô calculus
Appendix C. Basic properties of Hermite polynomials and Hermite functions
Appendix D. Independence of bases in Wick products
