

Norwegian University of Science and Technology Department of Mathematical Sciences TMA4220 Numerical Solution of Partial Differential Equations Using Element Methods Fall 2013

Project 2

If you are not familiar with the Lebesgue spaces $L^p(\Omega)$ and the Sobolov spaces $H^p(\Omega)$, you should read section 2.3.1 and 2.4.0-2.4.2.

True or false:

- a) The set $S = \{v \in C^0(0,1) : v(\frac{1}{2}) = 1\}$ is a linear (vector) space.
- **b)** For $X = H_0^1\left((0,1)\right), \ L(v) = \int_0^1 xv dx$ is a linear functional.
- c) For $Z = \mathbb{R}$, $(x, y)_Z = |x| |y|$ is a valid inner product.
- d) The only v in $H^1(\Omega)$ for which $|w|_{H^1(\Omega)}$ (the H^1 semi-norm) is zero is v=0.
- e) The function $v = x^{3/4}$ is in $L^2((0,1))$; in $H^1((0,1))$; in $H^2((0,1))$.
- f) For $v = e^{-10x}$, $|v|_{H^2((0,1))} = |v|_{H^1((0,1))}$.
- 2 Consider the fourth-order problem:

$$u_{xxxx} = f$$
 in $\Omega = (0, 1)$,
 $u(0) = u_r(0) = u(1) = u_r(1) = 0$.

This "biharmonic" equation is relevant to, amongst other applications, the bending of beams.

a) Find a symmetric, positive form a over V and a linear form F such that the solution u of the equation satisfies

$$a(u, v) = F(v), \ \forall v \in V.$$

- **b)** How should V be defined?
- c) Do you think that $F(v) = v_x(\frac{1}{2})$ is a linear, bounded functional on V?
- 3 Consider the problem with a discontinuous jump in conductivities:

$$\begin{split} -\kappa^L u^L_{xx} &= f^L, \qquad 0 < x < \frac{1}{2}, \\ -\kappa^R u^R_{xx} &= f^R, \qquad \frac{1}{2} < x < 1, \end{split}$$

with boundary conditions

$$\begin{split} u^L\left(0\right) &= 0, \qquad u^R\left(1\right) = 0, \\ u^L\left(\frac{1}{2}\right) &= u^R\left(\frac{1}{2}\right), \\ \kappa^L u^L_x\left(\frac{1}{2}\right) &= \kappa^R u^R_x\left(\frac{1}{2}\right), \qquad \text{(continuity of flux)}. \end{split}$$

Here, κ^L and κ^R are strictly positive. Let $V = \{v \in H^1((0,1)) : v(0) = v(1) = 0\}$. Find a and F such that the solution u satisfies

$$a(u, v) = F(v), \quad \forall v \in V.$$

4 Given the Helmholtz problem

$$-u_{xx} + \sigma u = f \text{ on } (0, 1),$$

 $u(0) = u(1) = 0.$

where $\sigma > 0$ is a constant. Set up the weak form for this problem. Show that, when this problem is solved by a Galerkin method, using $V_h = \text{span } \{\phi_i\}_{i=1}^N$, the discrete problem can be written as

$$(A + \sigma M)\mathbf{u} = \mathbf{f}.$$

Set up the matrix M for $V_h = X_h^1$ on a uniform grid.
