

Plan for this exercise session

- ★ Recall some formulas that we need to use today
 - likelihood function for general counting process
 - Laplace transform
 - formulas for gamma distribution with mean 1 and variance δ
- ★ One situation with shared frailty models
 - cluster model with one binary covariate
- ★ Derive formulas from likelihood function for general counting process
- ★ Use formulas for Laplace transform of gamma distribution

Formulas to be used

- ★ Likelihood function for general counting process, (5.4) in ABG

$$L(\theta) = P_{\theta}(\text{data}) = \left[\prod_{i=1}^n \prod_{0 < t \leq \tau} \lambda_i(t; \theta)^{\Delta N_i(t)} \right] \exp \left\{ - \int_0^{\tau} \lambda_{\bullet}(t; \theta) dt \right\}$$

- ★ Laplace transform

$$\mathcal{L}(c) = E[e^{-cZ}]$$

$$\mathcal{L}^{(r)}(c) = (-1)^r E[Z^r e^{-cZ}]$$

- ★ Gamma distribution with mean 1 and variance δ

$$f_Z(z) = \frac{\left(\frac{1}{\delta}\right)^{\frac{1}{\delta}}}{\Gamma\left(\frac{1}{\delta}\right)} z^{\frac{1}{\delta}-1} \exp\left\{-\frac{z}{\delta}\right\}$$

$$\mathcal{L}(c) = (1 + \delta c)^{-\frac{1}{\delta}}$$

$$\mathcal{L}^{(r)}(c) = (-1)^r \delta^{r-1} (1 + \delta c)^{-\frac{1}{\delta}-r} \prod_{q=1}^{r-1} \left(\frac{1}{\delta} + q \right)$$
