Oppgave 1

a) X = balet po jenter som blir valgt ut i ein periode po 10 dagar

Tilfeldig uhal => 10 nach. forsoh

P(jenke valgt ut) = 9 = 0.6 i kvart forsøk

Reg: jenk eller gull ; kwart forsok

3: X er binomisk fordelt 0: XN B(10. 0.6)

 $P(X=6) = {\binom{10}{6}} 0.6^6 \cdot 0.4^4 = P(X=6) - P(X=5) = 0.6177 - 0.36692 0.25$

P(x>5) = 1 - P(x=5) = 1 - 0.3669 = 0.633

To grupper of juster Trukker at hilfelding whan hilbake legging =>

hypergeometrisk fordeling.

Y = dall po jenter som blir trukme ut

$$P(Y=6) = \frac{\binom{9}{6}\binom{6}{4}}{\binom{15}{10}} = \frac{60}{149} \times 0.4$$

C)
P(Minst 5 dagar for gull blir valget at)

= P(Junter blir vælgt ut du 4 forste dogune) = (0.6) 4 = 0.13

La 2 vere dalit på dager het I gut blir valgt ut.

 $P(2210|226) = P(2210) = \frac{0.6^4}{9(226)} = \frac{0.6^4}{0.6^5} = \frac{0.6}{9} = \frac{0.13}{0.6^5}$

La
$$X$$
 vere dagun Hahon blir valge at for 2. gong 3:
 X is negative trinomisk forder.

$$P(X = 15) = {\binom{14}{15}} {\binom{1}{15}}^2 {\binom{14}{15}}^{13} = {\binom{14}{15}}^{14} = 0.025$$

$$E[X] = \frac{n}{p} = \frac{2}{1/5}$$

$$E[X_H] = 15.0.7 = 10.5$$

$$\overline{E}(X_B) = 15.0.4 = 6$$

$$Var[x_H] = 15.0.7.0.3 = 3.15 = 0.7$$

$$X_{4} \approx N(10.5, 3.15), X_{3} \approx N(6, 3.6)$$

$$P(y \ge 20) = P(y \ge 21) \approx P(\frac{y - 16.5}{16.75} \ge \frac{21 - 16.5}{16.75}) - P(z \ge 1.78)$$

$$= 1 - \tilde{\Phi}(1.73) = 1 - 0.958\lambda = 0.0418$$

Med kontinuitels korrelogion

$$P(2 > 20.5 - 16.5) = 1 - \overline{4}(1.54) = 1 - 0.938 = 0.062$$

$$0 = X_{+} - X_{B} \approx N(4.5, 6.75)$$

$$P(D>1) \approx P(\frac{D-4.5}{16.75} > \frac{1-4.5}{16.75}) = 1-4(-1.347)$$

Med kontinuasjons appro ksimasjon

$$P(Z \ge 0.5 - 4.5) = 1 - \overline{4}(-1.54) = 1 - 0.062 = 0.938$$

$$E[Y_H] = 15.6.2 = 3$$
 $E[Y_B] = 15.0.3 = 4.5$

$$x_H + y_H$$
 er $B(15, 0.9)$ Sidan en kan

a)
$$E[e^{4x}] = M_x(4) = \int e^{4x} e^{-(x-6)} dx = e^{6} \int e^{-x(1-4)} dx$$

 $= e^{6} \left[-\frac{e^{-x(1-4)}}{1-4} \right]^{-6} \qquad \text{for} \quad 6 \leq 1$

$$\partial: M_X (\omega) = \frac{e^{\theta} - \theta(1-d)}{1-\theta} = \frac{e^{\theta}}{1-\theta}, \quad \theta \geq 1$$

$$M_{x}'(4) = \underbrace{\theta e^{\theta 4}}_{1-4} + \underbrace{\theta^{\theta 4}}_{(1-4)^{2}}$$

$$M_{x}''(4) = \frac{6^{2}e^{64}}{1-4} + \frac{4e^{64}}{(1-4)^{2}} + \frac{2e^{64}}{(1-4)^{3}} + \frac{2e^{64}}{(1-4)^{3}}$$

$$M_{\chi'}(0) = E[\chi] = \frac{\theta \cdot 1}{1} + \frac{1}{1} = \frac{\theta + 1}{1}$$

=)
$$Var[x] = E[x^2] - (E[x])^2 = \theta^2 + 2\theta + 2 - (\theta + 1)^2 = 1$$

$$L[6/x_1,...,x_m] = \frac{m}{11} e^{-(x_i - \xi)} = \frac{-\sum_{i=1}^{n} x_i - \xi}{e^{-i\xi}}$$

For a makerimere deune ma
$$t$$
 givas t so stor som mogeleg t Min $t = x_i$ for alle i 0 : $t = min \{x_1, \dots, x_m\}$
