Problem 1

a) Find the inverse Laplace transform

$$f(t) = \mathfrak{L}^{-1} \left\{ \frac{s^2 + 1}{s^2(s^2 - 4s + 9)} \right\}.$$

b) Solve the initial value problem

$$\begin{cases} y''(t) - 4y'(t) + 9y(t) = t, & t > 0; \\ y(0) = 0, y'(0) = 1. \end{cases}$$

Problem 2 The equation

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}, \quad -\infty < x < \infty, \quad t > 0,$$

describes an infinite vibrating string. The initial values are

$$u(x, 0) = \begin{cases} x + 1, & -1 < x < 0; \\ 1 - 2x, & 0 < x < \frac{1}{2}; \\ 0 & \text{otherwise,} \end{cases}$$

and the initial speed is $u_t(x, 0) = 0$. Sketch the shape of the string at time $t = \frac{3}{2}$.

Problem 3

a) Expand

$$g(x) = x^2 - \pi x, \quad 0 < x < \pi,$$

in a Fourier sine-series.

b) Solve the equation

$$u_{xx} + u_{yy} - 20u = 0$$

in the rectangle

$$0 < x < \pi, \quad 0 < y < 1.$$

The boundary values are

$$\begin{cases} u(0, y) = 0, \quad u(\pi, y) = 0, & 0 < y < 1; \\ u(x, 0) = 0, \quad u(x, 1) = x^2 - \pi x, & 0 < x < \pi. \end{cases}$$

Hint: Separate the variables.

Problem 4 Find the Laurent expansion around the point $z = i$ of the function

$$f(z) = \frac{1}{z^2 + 1}.$$

In which domain does the expansion converge?

Problem 5 Construct a conformal mapping $w = w(z)$ of the domain

$$-\frac{\pi}{4} < \arg(z) < +\frac{\pi}{4}$$

onto the half-plane $\operatorname{Im}(w) > 0$ such that $w(1) = 2i$.

Problem 6 Find the Fourier transform $\hat{f}(\omega)$ of the function

$$f(x) = \frac{1}{(x^2 + 1)(x^2 + 4)}.$$

Hint: The calculation of $\hat{f}(\omega)$ for $\omega > 0$ and $\omega < 0$ should be done separately.

Miscellaneous

- **Heaviside function** $u(t) = \begin{cases} 1, & t \geq 0 \\ 0, & t < 0 \end{cases}$, $u(t-a) = \begin{cases} 1, & t \geq a \\ 0, & t < a \end{cases}$
- **Dirac Delta function** $\delta(t-a)$ is zero everywhere except a and satisfies $\int_{-\infty}^{\infty} \delta(t-a)dt = 1$, moreover $\int_{-\infty}^{\infty} g(t)\delta(t-a) = g(a)$ for any continuous function g .
- **Convolution** For functions defined on the real line:
 $f * g(x) = \int_{-\infty}^{\infty} f(y)g(x-y)dy = \int_{-\infty}^{\infty} f(x-y)g(y)dy$, $-\infty < x < \infty$;
 for functions defined only on the positive half-axis:
 $f * g(x) = \int_0^x f(y)g(x-y)dy$, $x > 0$.
