# TMA4267 Linear Statistical Models V2017 (L10) <br> Part 2: Linear regression: Parameter estimation [F:3.2], <br> Properties of residuals and distribution of estimator for error variance Confidence interval and hypothesis for one regression coefficient 

## Mette Langaas

Department of Mathematical Sciences, NTNU
To be lectured: February 17, 2017

## Today

1. Properties for residuals (from the hat matrix), leading to properties for $\hat{\sigma}^{2}$,
2. Then, confidence interval and hypothesis test for regression coefficient.

## The classical linear model

The model

$$
\boldsymbol{Y}=\boldsymbol{X} \boldsymbol{\beta}+\boldsymbol{\varepsilon}
$$

is called a classical linear model if the following is true:

1. $\mathrm{E}(\varepsilon)=0$.
2. $\operatorname{Cov}(\varepsilon)=\mathrm{E}\left(\varepsilon \varepsilon^{T}\right)=\sigma^{2}$ I.
3. The design matrix has full $\operatorname{rank} \operatorname{rank}(\boldsymbol{X})=k+1=p$.

The classical normal linear regression model is obtained if additionally

$$
\text { 1. } \varepsilon \sim N_{n}\left(\mathbf{0}, \sigma^{2} \boldsymbol{I}\right)
$$

holds. For random covariates these assumptions are to be understood conditionally on $\boldsymbol{X}$.

## Results so far

- Least squares and maximum likelihood estimator for $\boldsymbol{\beta}$ :

$$
\hat{\boldsymbol{\beta}}=\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T} \boldsymbol{Y}
$$

with mean $\mathrm{E}(\hat{\boldsymbol{\beta}})=\boldsymbol{\beta}$ and $\operatorname{Cov}(\hat{\boldsymbol{\beta}})=\sigma^{2}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1}$.

- Restricted maximum likelihood estimator for $\sigma^{2}$ :

$$
\hat{\boldsymbol{\sigma}}^{2}=\frac{1}{n-p}(\boldsymbol{Y}-\boldsymbol{X} \hat{\boldsymbol{\beta}})^{T}(\boldsymbol{Y}-\boldsymbol{X} \hat{\boldsymbol{\beta}})=\frac{\mathrm{SSE}}{n-p}
$$

- Projection matrices: idempotent, symmetric/orthogonal:

$$
\boldsymbol{H}=\boldsymbol{X}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T}
$$

projects onto column space of $\boldsymbol{X}$

$$
\boldsymbol{I}-\boldsymbol{H}=\boldsymbol{I}-\boldsymbol{X}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T}
$$

projects onto space orthogonal to column space of $\boldsymbol{X}$
with important connection: predictions $\hat{\boldsymbol{Y}}=\boldsymbol{H} \boldsymbol{Y}$ and residuals $\hat{\varepsilon}=(\boldsymbol{I}-\boldsymbol{H}) \boldsymbol{Y}$

Putanen, Styan and Isotalo: Matrix Tricks for Linear Statistical Models: Our Personal Top Twenty, Figure 8.3.

## Quadratic forms [F:B3.3, Theorem B.2]

Random vector $\boldsymbol{X}$ with mean $\boldsymbol{\mu}$ and covariance matrix $\boldsymbol{\Sigma}$, symmetric constant matrix $\boldsymbol{A}$.

- Quadratic form: $\boldsymbol{X}^{T} \boldsymbol{A X}$.
- The "trace-formula": $\mathrm{E}\left(\boldsymbol{X}^{T} \boldsymbol{A} \boldsymbol{X}\right)=\operatorname{tr}(\boldsymbol{A} \boldsymbol{\Sigma})+\boldsymbol{\mu}^{T} \boldsymbol{A} \boldsymbol{\mu}$.

Then, let $\boldsymbol{X} \sim N_{p}(\mathbf{0}, \boldsymbol{I})$, and $\boldsymbol{R}$ is a symmetric and idempotent matrix with rank $r$.

$$
\boldsymbol{X}^{T} \boldsymbol{R} \boldsymbol{X} \sim \chi_{r}^{2}
$$

Now, also $S$ is a symmetric and idempotent matrix with rank $s$, and $\boldsymbol{R S}=\mathbf{0}$.

$$
\frac{s \boldsymbol{X}^{\top} \boldsymbol{R} \boldsymbol{X}}{r \boldsymbol{X}^{\top} \boldsymbol{S} \boldsymbol{X}} \sim F_{r, s}
$$

## Properties: $\hat{\boldsymbol{\beta}}$ and $\hat{\sigma}^{2}$

- Least squares and maximum likelihood estimator for $\boldsymbol{\beta}$ :

$$
\hat{\boldsymbol{\beta}}=\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T} \boldsymbol{Y}
$$

has mean $\mathrm{E}(\hat{\boldsymbol{\beta}})=\boldsymbol{\beta}$ and $\operatorname{Cov}(\hat{\boldsymbol{\beta}})=\sigma^{2}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1}$.

- In addition $\hat{\boldsymbol{\beta}}$ is best linear unbiased estimator (BLUE), that is, among all unbiased estimator it has minimum variance in each component. (More in TMA4295 Statistical Inference.)
- For the normal model: $\hat{\boldsymbol{\beta}} \sim N_{p}\left(\boldsymbol{\beta}, \sigma^{2}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1}\right)$.
- Restricted maximum likelihood estimator for $\sigma^{2}$ :

$$
\hat{\boldsymbol{\sigma}}^{2}=\frac{1}{n-p}(\boldsymbol{Y}-\boldsymbol{X} \hat{\boldsymbol{\beta}})^{T}(\boldsymbol{Y}-\boldsymbol{X} \hat{\boldsymbol{\beta}})=\frac{\mathrm{SSE}}{n-p}
$$

- For the normal model

$$
\frac{(n-p) \hat{\sigma}^{2}}{\sigma^{2}} \sim \chi_{n-p}^{2}
$$

## Acid rain in Norwegian lakes

Measured pH in Norwegian lakes explained by content of

- x1: $\mathrm{SO}_{4}$ : sulfate (the salt of sulfuric acid),
- x2: $\mathrm{NO}_{3}$ : nitrate (the conjugate base of nitric acid),
- x3: Ca: calsium,
- x4: latent Al: aluminium,
- $x 5$ : organic substance,
- x6: area of lake,
- x7: position of lake (Telemark or Trøndelag),

Random sample of $n=26$ lakes.

W. S. Gosset alias Student

## Historical: Student-t fordelingen

- W.S. Gosset (1876-1937) was employed by the Guinness Brewing Company of Dublin.
- Sample sizes available for experimentation in brewing were necessarily small, and Gosset knew that a correct way of dealing with small samples was needed.
- He consulted Karl Pearson (1857-1936) of Universiy College in London about the problem. Pearson told him the current state of knowledge was unsatisfactory.
- The following year Gosset undertook a course of study under Pearson. An outcome of his study was the publication in 1908 of Gosset's paper on "The Probable Error of a Mean," which introduced a form of what later became known as Student's t-distribution.
- Gosset's paper was published under the pseudonym "Student."
- The modern form of Student's t-distribution was derived by R.A. Fisher and first published in 1925.

## $t$-distribution

## DEF: $t$-distribution

Let $Z$ be a standard normal random variable and $V$ a chi-squared random variable with parameter $\nu$ (degrees of freedom). If $Z$ and $V$ are independent, the distribution of the random variable $T$

$$
T=\frac{Z}{\sqrt{V / \nu}}
$$

has probability density function

$$
h(t)=\frac{\Gamma[(\nu+1) / 2]}{\Gamma(\nu / 2) \sqrt{\pi \nu}}\left(1+\frac{t^{2}}{\nu}\right)^{-(\nu+1) / 2}
$$

for $-\infty<t<\infty$. This distribution is called the (Student) $t$-distribution with $\nu$ degrees of freedom.

- $\mathrm{E}(T)=0$ if $\nu \geq 2$.
- $\operatorname{Var}(T)=\frac{\nu}{\nu-2}$ if $\nu \geq 3$.

## Are $\hat{\boldsymbol{\beta}}$ and SSE are independent?

Independence - from Part 1:
Let $\boldsymbol{X}_{(p \times 1)}$ be a random vector from $N_{p}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$. Then $\boldsymbol{A} \boldsymbol{X}$ and $\boldsymbol{B} \boldsymbol{X}$ are independent iff $\boldsymbol{A} \boldsymbol{\Sigma} \boldsymbol{B}^{T}=\mathbf{0}$.

We have:

- $\boldsymbol{Y} \sim N_{n}\left(\boldsymbol{X} \boldsymbol{\beta}, \sigma^{2} \boldsymbol{I}\right)$
- $\boldsymbol{A} \boldsymbol{Y}=\hat{\boldsymbol{\beta}}=\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T} \boldsymbol{Y}$, and
- $\boldsymbol{B Y}=(\boldsymbol{I}-\boldsymbol{H}) \boldsymbol{Y}$.
- Now $\boldsymbol{A} \sigma^{2} \boldsymbol{I} \boldsymbol{B}^{T}=\sigma^{2} \boldsymbol{A} \boldsymbol{B}^{T}=\sigma^{2}\left(\boldsymbol{X}^{T} \boldsymbol{X}\right)^{-1} \boldsymbol{X}^{T}(\boldsymbol{I}-\boldsymbol{H})=\mathbf{0}$
- since $\boldsymbol{X}(\boldsymbol{I}-\boldsymbol{H})=\boldsymbol{X}-\boldsymbol{H X}=\boldsymbol{X}-\boldsymbol{X}=\mathbf{0}$.
- We conclude that $\hat{\boldsymbol{\beta}}$ is independent of $(\boldsymbol{I}-\boldsymbol{H}) \boldsymbol{Y}$,
- and, since SSE=function of $(\boldsymbol{I}-\boldsymbol{H}) \boldsymbol{Y}: S S E=\boldsymbol{Y}^{\top}(\boldsymbol{I}-\boldsymbol{H}) \boldsymbol{Y}$,
- then $\hat{\boldsymbol{\beta}}$ and SSE are independent.

Quantiles and critical values: N og $t: \alpha / 2=0.025$

## Today

- Distribution of SSE/ $\sigma^{2}$ is chisquared $(n-p)$.
- Independence of $\hat{\boldsymbol{\beta}}$ and SSE.
- Inference about $\boldsymbol{\beta}$ components can be performed using the $t$-distribution
